supplier: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a lahr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mm Nacl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 12hr, 14d, 2d, and 4d; roots12hr, 6hr, 12hr, and 2d).
Set 2 were grown under the standard conditions applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; roots:3d
and 5d). Set 3 were grown under the standard conditions
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d. Set 4 were grown under the standard conditions and
then were beat stressed by placement at 3 C. Heat
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and heat-stressed at 2 hr, 6 hr, 12 hr, 1 d,
br, 1 A and 4d and heat-stressed at 2 hr, 6 hr, 12 hr, 1 d,
br, 1 h and 4d and heat-stressed at 2 hr, 6 hr, 12 hr, 1 hr,
br, 1 h and 4d and heat-stressed tools were harvested at 6 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and solds were harvested at 8 hr, 8 hr, 12 hr, 10 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and foods were harvested at 8 hr,
br, 1 h and 4d and heat-stressed roots were harvested at 6 hr,
br, 1 h and 4d and 6d for sold stressed leaves were harvested at 6 hr,
br, 1 h and 4d and 6d for sold stressed leaves were harvested at 6 hr,
br, 1 h and 4d and 6d for sold stressed leaves were ha

The sequences are based on single pass reads.
Life Technologies (a division of Invitrogen) members carried out full-length libraixies construction: Temple G.
Genoscope members carried out sequencing and annotation: Castell V. Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salanoubat M.
URGV INRA: Clepet C., Caboche M.
Mancation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap.
                                                                                                                                                                                                                                                                                                                                    TTAGGAACAAGAAGGCACTCCTCCAGGAAATCGAAAAACAGTTTGATGATCTCCCAAAACA

Were genoscope.coms. Interest is sequenced by the sequences are based on single pass reads.

The sequences are based on single pass reads.

Life Technologies (a division of Invitrogen) members carried out full-length librairies construction: Temple G.

Genoscope members carried out sequencing and annotation: Castelli V., Aury J.M., Jaillon O., Wincker P., Menard M., Cruaud C., Schachter V., Weissenbach J., Salanoubat M.

Manotation is based on the June 2003 version of the Arabidopsis genome released by MIPS (Munich Information center for Protein Sequences). 5 prime and 3 prime are assembled with Phrap.

Ramirez-Parra E; Gutierrez-Armenta C,

WPI; 2001-257972/26. N-PSDB; AAF80144. New isolated, enriched, cell free and/or recombinant nucleic acid useful for e.g. altering cell proliferation characteristic such as to alter plant cell, organ or tissue size.

Claim 7; Fig 1; 77pp; English.

The present sequence represents a E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to 3 phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoms protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoms protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and particularly to alter cell proliferation characteristic such as to alter plant cell, organ or tissue

The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related polypeptide. The present sequence is published separately from the main body of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-OCT-1999
```

The invention relates to a novel cell cycle protein (CCP) and the polympication and the activity of the polympicate and which binds to the witch modulates the activity of the polympicate and which binds to the polympicate and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP antibody is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, converse to maize, tomato, alfalfa, oilseed rape, soybean, sufflower and canola. CCC maize, tomato, alfalfa, oilseed rape, soybean, sufflower and canola. CCC maize, tomato, alfalfa, oilseed rape, soybean, sufflower and canola. CCC maize, tomato, alfalfa, oilseed rape, soybean, sufflower and canola. CCC concletes characterised by insufficient or excessive production of CCP protein forms which have decreased or absorbers characterised by insufficient or excessive production of CCP protein forms which have decreased or aborted activity. Compounds that bind too modulating about morphology, bichemistry and/or physiology, the length of the CCP polympicies or plant growth regulators. The polymcleotide is useful for modifying cell fate, plant development, of coll division, DNA replication, promotion, stimulation or enhancement of cell division, DNA replication, seed set, seed development, tuber, fruit, lenf formation, seed set, senticody are useful in agriculture to modulate the conditions, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold mutrient deprivation, heat, drought, salt stress, or biotic stress such as cold mutrient deprivation, heat, drought, salt stress, or biotic stress such as cold mutrient deprivation, heat, drought, salt stress, or biotic stress such as pathogen attack, to modulate e.g. enhance crop yields, and attenuate plant quality traits, plant reproduction and seed carear antibodies. CCP protein is useful to screen for and tremand condulate e.g. enhance is useful as an immunogen to courring CCP substrates. The poly

The present invention relates to novel plant transcription factor

proteins (1) and nucleotide sequences (II) (ADO61534-ADO63778). The

proteins (1) and nucleotide sequences (II) (ADO61534-ADO63778). The

sequences can be used to produce transgenic plants, which overexpress

(II), where the transgenic plant has an allered trait as compared to a

non-transgenic plant or wild-type plant. The transgenic plant comprises

an altered trait selected from increased tolerance to calid, increased tolerance to cold, increased tolerance to cold,

increased germination in cold, increased tolerance to heat, increased

c germination in heat, increased tolerance to heat, increased

c increased dermination in cold, increased tolerance to disease, including

thompsphate conditions, increased tolerance to disease, including

c increased tolerance to multiple fungal pathogens, increased tolerance

c low phosphate conditions, increased tolerance to

c low phosphate conditions, increased tolerance to

c low phosphate conditions, increased tolerance to

c low phosphate conditions, increased tolerance to

c low phosphate conditions, increased tolerance to

c low phosphate conditions, increased tolerance to

c low phosphate conditions, increased tolerance

c low phosphate conditions, increased tolerance

c lowering, altered dabout meristem development, altered branning pattern,

altered stem morphology, altered wascular tissue structure, reduced

apical dominance, altered trichome density, altered trichome structure, altered seed

c altered stem morphology, altered vascular tissue structure, altered seed

c altered call proliferation, altered col development, altered seed

c altered call proliferation, altered coll expansion, altered seed

c altered sensescence, abnormal embry development, altered brand mass, light

c green or gray leaves, glossy leaves, altered seed ripening, altered seed

c death, lethality when overexpressed, altered seed sigh pattern, altered seed coloration, altered seed coloration, altered seed coloration, altere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seed, increased leaf wax, increased leaf fatty acids, altered seed oil content, altered seed protein content, altered seedprenyl content, altered leaf prenyl lipid content, increased anthocyanin levels, and decreased anthocyanin levels. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at five wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       37 GNAVORKGAVDPDKDRKKEKAAAPRITGWGLREYSKIVCEKVEAKGRITYNEVADEIYSE
                                                                                                                                                                                                                                                                                                                                            Reuber TL;

                          Plant; transcription factor; transgenic plant; abiotic stress tolerance; semcite stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phobbate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to cold, increased tolerance to cold, increased tolerance to cold, increased tolerance to heat, increased germination in heat, increased tolerance to heat, increased germination in heat, increased tolerance to increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.

altered stem morphology, altered vascular tissue structure, reduced
apical dominance, altered trichome density, altered trichome development,
altered trichome structure, altered coor development, altered shade
avoidance, altered seed development, altered seed ripening, altered seed
avoidance, altered seed development, altered cell differentiation,
altered cell proliferation, altered cell expansion, altered phase change,
altered senescence, abnormal embryo development, altered phase change,
altered senescence, abnormal embryo development, altered programmed cell
cath, lethality when overexpressed, altered necrosis patterns, increased
plant size, increased biomass, large seedlings, dwarfed plants, dark
cypteen leaves, change in leaf shape, increased leaf size and mass, light
green or gray leaves, glossy leaves, altered abaxial/daxial polarity,
altered seed coloration, altered seed size, altered seed shape, large
content, altered seed protein content, altered seed shape, and
content, altered seed protein content, altered seedprenyl content,
altered leaf prenyl lipid content, increased anthocyanin levels, and
decreased anthocyanin levels. Note: The sequence data for this patent did
not form part of the printed specification, but was obtained in
caterionic format directly from WIPO at
ftp. wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          'n

The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related polypeptide. The present sequence is published separately from the main body of the specification as EPO data.

The invention relates to a novel cell cycle protein (CCP) and the polymeolectides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for identifying a compound of CCP in a sample. A CCP modulator is useful for modulating the presence of CCP in a sample. A CCP modulator is useful for modulating the presence of CCP in a sample. A CCP modulator is useful for modulating the presence of CCP in a plant such as Arabidopsis thaliana, rice, wheat, mainted and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein or production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polypeptide are useful as herbicides or plant growth regulators. The polypeptide are useful as herbicides or plant growth regulators. The polypeptide is useful for modifying cell fate, plant development, compounds that plant in intiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, S and/or M phase of the cell cycle of a plant, initiation and/or development, under function, dwarfism in plants, creased are as seed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, tuber, fruit, leaf formation, shoot and root initiation and/or development, module function, dwarfism in plants, crease such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress and attenuate plant architecture, plant quality traits, plant reproduction and seed development, modulate e.g. enhance crop yields, and attenuate plants or its parts. CCP is useful for avpressing CCP cocurring CCP substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                133
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    97 LKSMAHIG-----QGFDEKNIRRRVYDAFNVLIALRVIAKEKKRIRWMGLSNYRYEKIKK 151

                                                                                                                                                                                                                                                                                    The present invention relates to an isolated nucleic acid molecule encoding a cell proliferation-related polypeptide. The nucleic acid molecule and the encoded polypeptide, and methods are useful for modulating cell proliferation, senescence, differentiation, development, and stress response in plants, and for producing enhanced food crops. The present sequence represents a cell proliferation-related polypeptide. The present sequence is published separately from the main body of the
